

## SEA PUMP TOOL KIT

625-4206

This stud tool kit is designed to help with the installation of the Mercury rear sea pump housing. Once the pump has been disassembled thread these studs into 2 of the 5 threaded holes in the pump housing. Now you can install the new impeller and other new components by sliding them down the studs. When installing the new housing turn the pump shaft while pressing down on the housing. Once the housing seats in place install the 3 remaining bolts before removing the 2 alignment studs and replacing them with bolts.

There is a video available on rebuilding a pump using this kit available at [hardin-marine.com](http://hardin-marine.com).
